## Progress on implementing the 10 Roadmap actions in GPC focus countries - 2023

Many countries have assessed their HIV epidemics, set granular targets, adapted their Road Maps and developed costed HIV plans. But more focus is needed on sub-national targets and plans—and on allocating investments in ways that will scale up and sustain national prevention programmes.

Countries have put in place important elements of countryand community-led HIV prevention. However, many countries are yet to define specific actions to strengthen genuine country- and community-led prevention systems.

Criminalization, stigma and discrimination are major barriers for HIV prevention globally. Country-specific milestones can help define viable actions to address those barriers.

Technological advances offer opportunities to develop new approaches for scaled-up and cost-efficient HIV prevention communication and access. A wide range of digital and other virtual interventions is already available. Artificial intelligence opens further opportunities for fresh solutions.
