* The number of condoms per couple-year represents the total number of condoms distributed and sold in a year, divided by half the population aged 15-64 in a country (assuming that each condom is used in a sexual act involving two persons). Both male and female condoms are included in the number of condoms distributed and sold. The total male population 15-64 was used as a proxy for the denominator mathematically, while acknowledging that condoms are used between women and men, between two men and by people with other gender identities. The indicator as a whole provides a proxy for comparing condom distribution numbers in different countries relative to population size. The following indicator on % of condom distribution need met provides a more granular estimate of the proportion of condom need met among sexually active people of all ages including key populations for prevention of HIV, STIs and unintended pregnancy.
