New HIV infections among adults aged 15+

- 2010: 9200
- 2011: 8200
- 2015: 2750
- 2018: Not available
- Target: 2750

New HIV infections among adults declined by 27% between 2010 and 2018, which is too slow to achieve the 2020 targets. Programme scale-up is needed.

**HIV prevalence among young people (%):**
- Gay men and other men who have sex with men: 10%
- Women aged 15–24: 5%
- Men aged 15–24: 4%
- Sex workers aged 15–24: 8%
- People who inject drugs aged 15–24: 8%
- Target: 40%

**Next steps:**
- Finalize the National Operational Plan, including the necessary actions to scale up programmes for the five pillars of prevention.
- Conduct a People Living with HIV Stigma Index survey.
- Finalize the National Monitoring and Evaluation Plan.
